Intro

Have you ever used your smartphone to track your workout..

Intro

Only to end up getting distracted?

Target Population & Problem

■ Target Population

- People going to the gym who aim to maintain an uninterrupted "Flow State".

■ Problem

- Interaction with phone screens interrupts the natural flow of exercise.

Existing System Limitations

- **Screen-Based Design**
 - Existing apps require manual touch input for logging
- **Physical Inconvenience**
 - Touch interaction is impractical during continuous activities or when handling equipment with sweaty hands
- **Lack of Alternatives**
 - Current systems fail to provide hands-free or audio-based interaction method suited for active physical contexts

Needfindings & Insight

- Prevent Digital Distraction & Flow Disruption
- Eliminate Physical & Interaction Friction
- Adapt to environmental unpredictability without visual menu navigation

Prevent Digital Distraction & Flow Disruption

■ Evidence

- "I just meant to log... But ended up scrolling"
- "My rest becomes much longer than intended"
- "Notifications ruined my concentration"

■ Insight

- The smartphone acts as a distraction trigger, not just a tool
- Even intentional use easily leads to unintended context switching

■ What it matters

- Workout efficiency
- Rest time uncontrolled
- Breaks flow state

Eliminate Physical & Interaction Friction

- Evidence
 - "Logging every set is such a hassle"
 - "I have to keep moving my phone around"
 - "Sweaty hands make touch interaction difficult"
- Insight
 - Current interaction is too effortful for a high-intensity physical context
- What it matters
 - Leading to non-recording
 - UX friction → fails to adoption

Adapt to environmental unpredictability without visual menu navigation

■ Evidence

- "The gym is always packed... I have to swap my routine on the spot"
- "It's hard to rethink my whole plan without seeing a list of options on my phone"

■ Insight

- Real-world environments require non-linear adaption rather than just a fixed sequence

■ What it matters

- Workout continuity ↓ (if equipment is occupied)
- Cognitive load ↑ (under physical fatigue)
- Breaks Eyes-free state (forced to check visual menus)

Persona : Kim Minji

■ Role

- An efficiency-oriented office worker and dedicated gym-goer aiming for consistent muscle growth.

■ Behavioral Patterns

- Visits the gym 4–5 times a week after work, strictly following a set routine and rest intervals.
- Attempts to log workouts via smartphone apps but frequently gets sidetracked by notifications or mindless scrolling.

■ Goal

- To maximize workout efficiency by maintaining a continuous "Flow State" without interruptions.

■ Key Characteristics

- Dislikes handling a smartphone with sweaty hands during high-intensity sets and feels cognitive strain when crowded gym conditions force her to change her planned routine.

Persona : Kim Minji

I have to put my phone away while doing exercise!

Oh, the machine is already used!

Oh.. I spent time watching reels!

I want more advanced UI to help me!

Persona : Kim Minji

I have to put my phone away while doing exercise!

Oh, the machine is already used!

How can UI help her?

Oh.. I spent time watching reels!

I want more advanced UI to help me!

Proposed Solution

- **Audio-Based Guidance**
- **Low-Interaction Control**
- **AI-Powered Adaptive Planning**

Audio-Based Guidance

The system delivers real-time instructions through wireless earbuds, such as:

- Next exercise
- Remaining rest time
- Target weight or reps

→ This enables an eyes-free experience, preventing digital distraction and maintaining flow.

Low-Interaction Control

Workout data (sets, reps, rest time) is recorded automatically, removing the need for manual input.

Simple controls using earbuds:

- Tap to skip
- Pause / Resume
- No need to hold or touch the phone screen

→ Designed for high-intensity physical contexts

AI-Powered Adaptive Planning

Simple Pre-Workout Setup through AI

When disruptions detected (e.g., unavailable equipment):

- Suggests alternative exercises (same muscle group, similar intensity)
- Delivered through audio (no screen needed)

→ Transforms workouts from static routines :
dynamic, adaptive experiences

Congratulations, Kim Minji!

Automated
Planning!

New UI helps my
Gym workout!

No need to watch
screen!

Future Plan

- Already collected survey of 13 people
 - their workout status and their inconvenience while using existing workout application
- Make prototype application as soon as possible
- Have a alpha-test for person who attended our interview
- Constantly update application by feedback-loop
